Trade with Discipline Not Emotion

The validation layer that sits between your trading decisions and the exchange — catching mistakes before they cost you money

TESTUDO · 2026

THE PROBLEM

Retail traders lose money on trades they never should have taken

The exchange lets you enter any position at any size. There is no gatekeeper. The mistakes are mechanical — and repeatable.

2.4×

Average size increase after a loss — classic revenge trading

0

Built-in safety checks on most exchanges before an order is placed

-67%

Typical account drawdown from unmanaged risk in volatile markets

The problem is not your strategy. It is the absence of a gate between the idea and the order.

THE SOLUTION

Testudo validates every trade before it ever reaches the exchange

1 You decide what to trade

Your strategy. Your edge. Testudo does not tell you what to buy — that is your call.

2 Testudo answers: how much, and is it safe?

Position sizing across multiple methods — Kelly criterion, fixed fractional, risk-budgeted. The most conservative answer wins.

3 Testudo executes, monitors, and manages the exit

Entry, stop-loss, and take-profit placed as a linked group. Break-even automation. Trailing stops. Partial take-profit.

Your strategy decides direction. Testudo decides size, safety, and execution.

Three stages. One path. No trade skips the gate.

V Validation

Decision Loop checks exposure. Position Sizer picks quantity — the smallest of account %, fixed risk, max size, and margin capacity. Shadow Engine simulates against in-memory state. Rejected trades never leave the server.

E Execution

Validated orders route to the exchange via native Hyperliquid SDK or CCXT for CEX venues. Entry, stop-loss, and take-profit are placed as one linked group. Cancel one, cancel all.

M Management

Price Feed polls every 2 seconds. Trade Manager handles break-even triggers, trailing stops, and partial take-profit. Fill Detector listens via WebSocket and cancels OCO siblings when one leg fills.

R Recovery

If the server restarts, positions rehydrate from the database and verify against the exchange. Nothing is lost. The Shadow Engine rebuilds state and continues managing.

The Decision Loop is the single gate every trade must pass

What it checks

Account exposure limits

Position size across multiple methods

Margin capacity and free balance

Symbol-level risk concentration

Correlation overlap with open positions

Exchange-level rate limits

How it decides

The most conservative of four sizing methods wins — the Position Sizer returns the smallest quantity, not the average. When real money is on the line, the safest answer is the only answer.

Kelly criterion · Fixed fractional · Max risk-budgeted · Margin-gated

Paper trade with full price-time-priority matching before risking a single dollar

What the Shadow Engine does

An in-memory mirror of every active position and order. It runs a full orderbook with BTreeMap-based bids and asks, matching orders using the same price-time-priority rules as a real exchange.

What it gives you

Test a new strategy across weeks of real price action — no capital at risk. See your win rate, drawdown profile, and Sharpe ratio before you commit. When you go live, the Shadow Engine tracks your real positions so decisions never wait on API round-trips.

Backtest with real market microstructure. Deploy with confidence.

INTELLIGENCE

The Coach finds your trading leaks before they drain your account

Six behavioral patterns detected weekly from your trade history. Each one anchored to specific trades — not vague advice.

Sizing Drift	Position size jumped 2.4× baseline after a loss. Classic revenge-trading fingerprint.
Frequency Spike	You opened 34 trades in a 6-hour window — 3.1× your 30-day baseline. Euphoria chase.
Session Anomaly	Trades executed at 3:14 AM UTC — well outside your typical active hours. Fatigue risk.
Setup Fatigue	Your breakout setup is degrading: 0.82 R baseline → 0.41 R this week. Regime shift warning.
Correlation Stack	Three L1 longs held simultaneously for 7 hours. Nominally diversified, structurally one bet.
Streak Risk	Five consecutive wins with position size doubling across the run. The largest give-backs follow.

CONNECTIVITY

One interface controls every exchange you trade on

Venues supported

Binance

Hyperliquid (native SDK)

Bybit

Coinbase

Kraken

OKX, WOO X, Bitget, Blofin

All CEX venues via CCXT sidecar. Hyperliquid via direct API for zero-latency execution.

Unified risk view

Testudo aggregates positions across all your connected accounts. One net exposure number. One correlation stack. One margin snapshot. You see the risks that cross venue boundaries — the kind a single-exchange dashboard misses entirely.

Diversify across venues. Manage risk across all of them.

Dignitas proves you can trade — on-chain, verifiable, permanent

What it measures

Drawdown adherence — do you exit when you said you would?

Risk-per-trade consistency — is your sizing predictable?

Setup adherence — do you trade what you planned?

Coach responsiveness — do you fix the leaks the Coach finds?

Journal consistency — do you document your reasoning?

What it unlocks

A single score, publicly visible. A streak counter — days without a discipline violation. A sparkline showing your trajectory. In a market where everyone claims alpha, Dignitas is the proof. Share your handle. Let the numbers speak.

Alpha is a claim. Discipline is verifiable. Dignitas shows which one you have.

NEXT STEPS

Start trading with the discipline of an institution

Testudo is the validation layer the market has been missing. Your strategy. Our guardrails.

0

Unchecked orders — every trade hits the Decision Loop

6

Behavioral patterns the Coach watches for every week

All

Major CEX venues + Hyperliquid — one interface

Validation. Execution. Management. Recovery. Testudo handles the parts that are not your edge — so you can focus on the part that is.
